CURRENT TRENDS

MEASLES - 1967

The pattern of a gradually increasing incidence of measles cases observed during the first 5 weeks of 1967 is continuing (Figure 1). For the 6th week (ending February 11), 2,406 cases were reported. This total is 201 cases more than for the previous week, but is 4,613 cases less than for the comparable week of 1966.

Five states reported more than 100 cases for the current week: Arkansas - 512; California - 149; Tennessee - 182; Texas - 457; and Washington - 251. A large percentage of the total number of cases reported from Arkansas for the sixth week represents delayed reports from the last week of January and the first week of February.

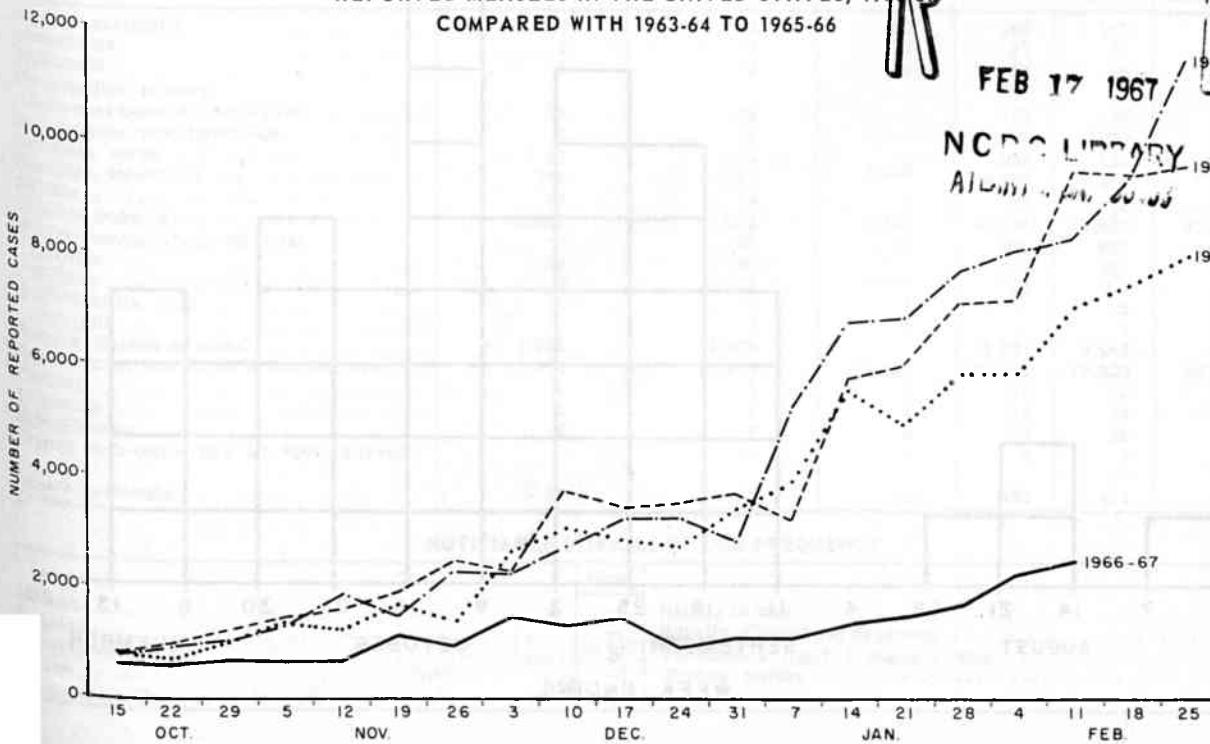

CONTENTS

Current Trends	
Measles - 1967	45
Epidemiologic Notes and Reports	
Hepatitis - New Mexico	46
Reported Cases of Infectious Syphilis -	
January 1966 - January 1967	47

The cumulative number of cases for the first 6 weeks of 1967 is 10,326. During the same 6-week period in 1966, cases totaled 33,022, and for the previous 3 years the respective totals were 42,629, 38,191, and 51,041. Thus, the current year's total is approximately one quarter of the mean number of cases for the comparable 6-week period of the previous 4 years.

(Reported by the Childhood Viral Diseases Unit, Epidemiology Program, CDC.)

EPIDEMIOLOGIC NOTES AND REPORTS
HEPATITIS ON ZUNI INDIAN RESERVATION
New Mexico

Between August 1 and November 20, 1966, 51 cases of hepatitis are known to have occurred among Indians living on or near the Zuni Indian Reservation in northwestern New Mexico. No cases had been reported during the first 7 months of 1966. All of the patients had typical icteric illnesses characterized by fever, nausea, malaise, abdominal pain, and hepatomegaly. These illnesses were generally mild and there were no deaths. Liver function tests performed on 46 of the patients showed abnormalities consistent with viral hepatitis.

Of the 51 patients, 48 were Zuni Indians and 3 were Navaho Indians living in the Ramah-Navaho Area southeast of the Zuni Reservation. Only one of the latter three patients had either visited Zuni or had had known contact with persons from Zuni.

The age and sex distribution of the 51 cases is shown in Table 1. Forty-five of the 51 patients were less than 10 years old, and of these, 42 were clustered between 2 and 7 years of age. Twenty of the patients were males and 31 were females.

The epidemic curve by week of onset shows an initial small cluster in mid-August, followed by a single wave

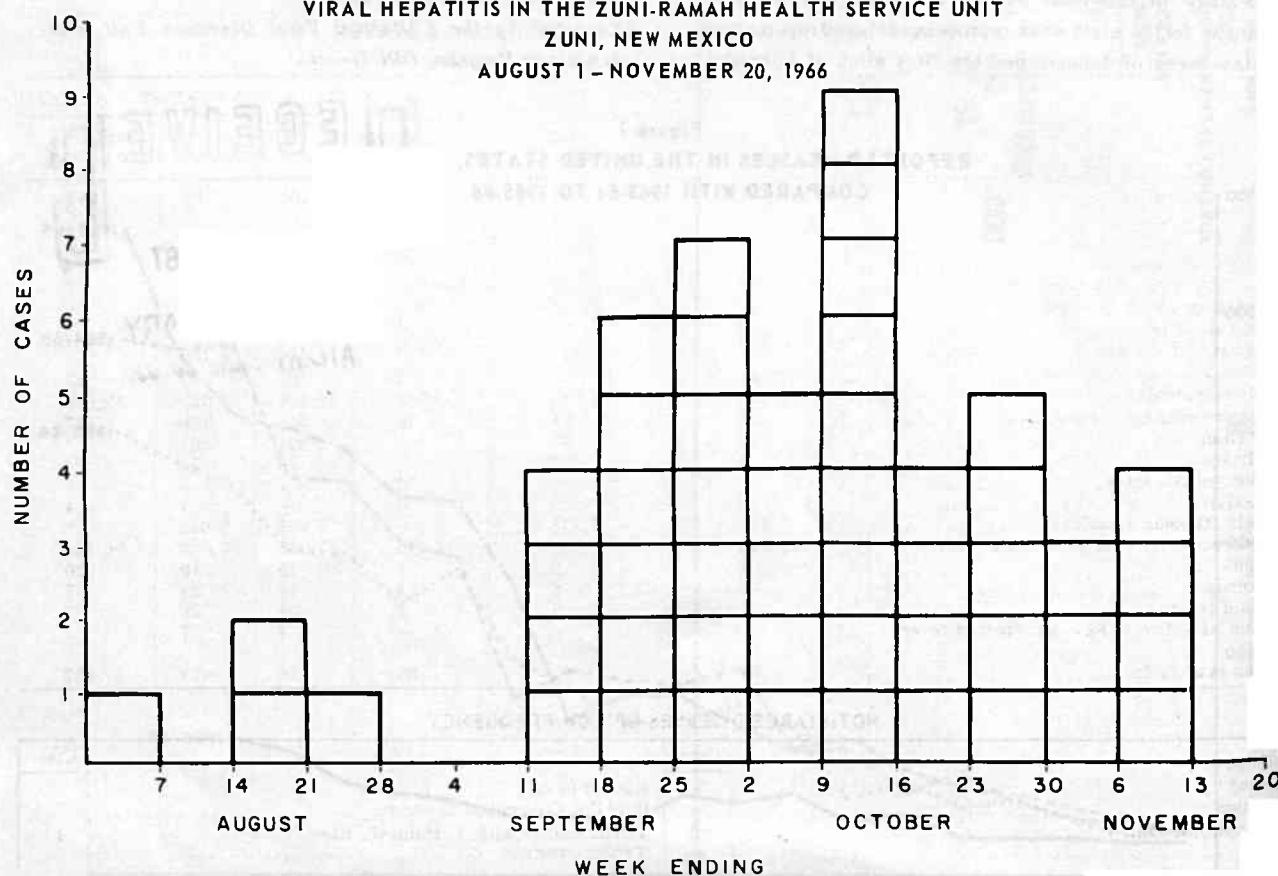

Table 1
Age and Sex Distribution of 51 Cases of Viral Hepatitis
Zuni-Ramah Health Service Unit, Zuni, New Mexico

Age	Males	Females	Total
0 - 4	8	14	22
5 - 9	9	14	23
10 - 14	1	1	2
15 - 19	0	1	1
20 - 29	0	0	0
30 - 39	1	1	2
40 - 49	1	0	1
50+	0	0	0
Total	20	31	51

with the peak number of cases having onsets during the week ending October 16 (Figure 2). There was no significant geographic aggregation of cases. Thirty-four percent of the patients had had definite contact with a prior case of hepatitis 2 weeks to 2 months prior to their onsets.

Cumulative Totals
including reported corrections for previous weeks

All Causes, All Ages ----- 79,744
All Causes, Age 65 and over----- 45,963
Pneumonia and Influenza, All Ages----- 3,258
All Causes, Under 1 Year of Age----- 4,101

*Estimate - based on average percent of divisional total.

EPIDEMIOLOGIC NOTES AND REPORTS
HEPATITIS ON ZUNI INDIAN RESERVATION
 New Mexico - (*Continued from page 46*)

Cases among older children tended to occur early in the epidemic while cases among younger children had later onsets. Of 21 cases occurring on or before October 2, only 4 (19 percent) were in children from 0 to 4 years of age, while among the 30 cases occurring after October 2, 18 (60 percent) were in children between 0 and 4 years of age.

Thirty of the 51 cases were in children attending school, most of whom were in the lower grades, and 17 of the cases were in preschool children. However, there was no particular concentration in any elementary school and no particular aggregation of ill children in certain classrooms. Furthermore, those patients having histories of contact with a prior case had that contact away from school.

The occurrence of cases over an interval of nearly 4 months, together with the predominance of cases among children, suggests that the mode of transmission was person-to-person. The clustering of cases in children 7 years of age and younger appears to represent new susceptibles introduced into the community since 1960-61, the last epidemic year at this Reservation.

During the course of the epidemic, gamma globulin was administered to household contacts of each patient and to other children in the same classroom as the patient. More than 70 percent of the younger school children received globulin while only about 5 percent of the preschool group received it. It was observed that, as an increasing level of passive immunization among the older group was achieved, the proportion of cases among preschool children increased. Subsequently, the overall incidence declined. Thus, the administration of immune globulin chiefly among one segment of the susceptible population appears to have been important in limiting the epidemic.

(Reported by Dr. E.F. McIntyre, Assistant, Indian Health Area Director, Albuquerque Field Office, Division of Indian Health, Bureau of Medical Services, PHS; Dr. Richard W. Sauerman, Service Unit Director, USPHS Indian Hospital, Gallup, New Mexico; Dr. Thomas H. Tomlinson Jr., Associate Director, Human Factors, New Mexico Department of Public Health; and a team from CDC.)

ERRATUM: Vol. 16, No. 4, p. 25:

Virginia, not West Virginia, reported 133 measles cases (including delayed reports) for the week ending January 28, 1967.

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 17,000, IS PUBLISHED AT THE NATIONAL COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

DIRECTOR, NATIONAL COMMUNICABLE DISEASE CENTER
 DAVID J. SENCER, M.D.
 CHIEF, EPIDEMIOLOGY PROGRAM
 A.D. LANGMUIR, M.D.
 ACTING CHIEF, STATISTICS SECTION
 IDA L. SHERMAN, M.S.

IN ADDITION TO THE ESTABLISHED PROCEDURES FOR REPORTING MORBIDITY AND MORTALITY, THE NATIONAL COMMUNICABLE DISEASE CENTER WELCOMES ACCOUNTS OF INTERESTING OUTBREAKS OR CASE INVESTIGATIONS WHICH ARE OF CURRENT INTEREST TO HEALTH OFFICIALS AND WHICH ARE DIRECTLY RELATED TO THE CONTROL OF COMMUNICABLE DISEASES. SUCH COMMUNICATIONS SHOULD BE ADDRESSED TO:

THE EDITOR
 MORBIDITY AND MORTALITY WEEKLY REPORT
 NATIONAL COMMUNICABLE DISEASE CENTER
 ATLANTA, GEORGIA 30333

NOTE: THE DATA IN THIS REPORT ARE PROVISIONAL AND ARE BASED ON WEEKLY TELEGRAMS TO THE NCDC BY THE INDIVIDUAL STATE HEALTH DEPARTMENTS. THE REPORTING WEEK CONCLUDES ON SATURDAY; COMPILED DATA ON A NATIONAL BASIS ARE RELEASED ON THE SUCCEEDING FRIDAY.
